

# The updated land carbon cycle in SURFEXv8

# Simulated processes in ISBA

# Simulating major missing processes in ISBA

## Updated Processes on major biomes of the world

- rainforest (E. Joetzjer PhD, 2014)
- same approach with TRY database for other biomes, benchmarked with Fluxnet data

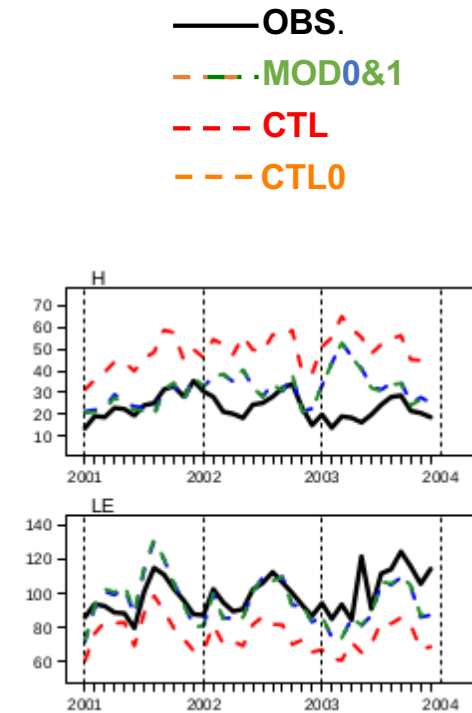

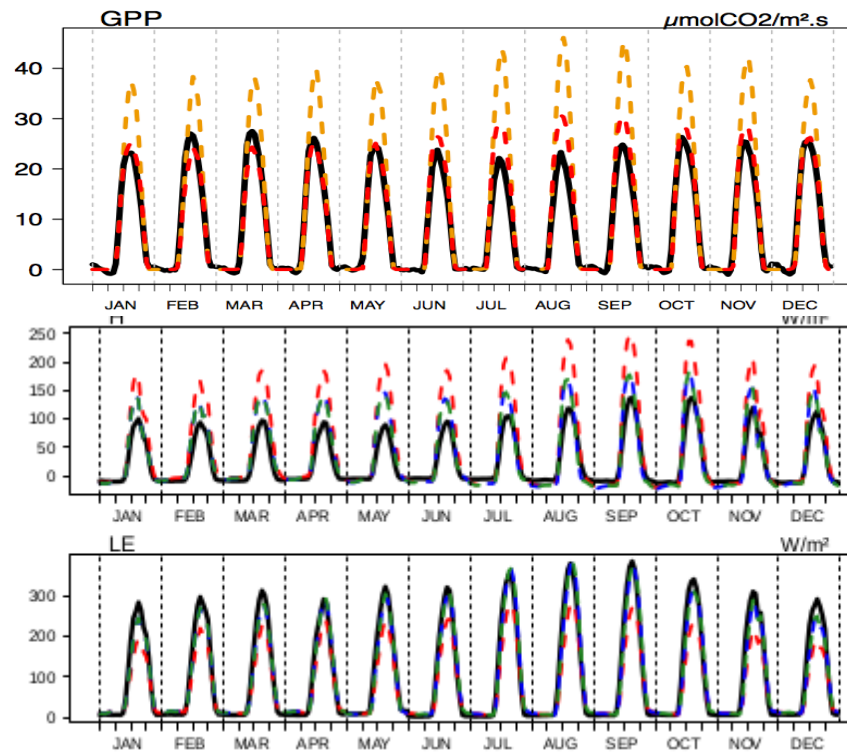

## New processes

- New discretized soil C model, anaerobic decomposition, CH<sub>4</sub> emissions, gas diffusion (Xavier Morel, previous talk, work in progress)
- 16 plant functional types instead of 9 (+ bare soil, rock, permanent snow/ice)
- land-use / land cover changes : yearly input maps
- C leaching to river → ocean
- Natural fires

# Updated processes : Amazon forest *PhD E. Joetzjer (2014)*

## Santarem km83

## Biomass Caxiuana

## ISBA

overestimation of GPP (CTL0)

•underestimation de LE

•underestimation living biomass and soil C

•strong overestimation of leaf respiration (CUE too small)

**TRY**

# Plant Trait Database

*Fagus sylvatica*  
245 traits

[Home](#)

[About TRY](#)

[Data Portal](#)

## Quantifying and scaling global plant trait diversity

TRY is a network of vegetation scientists headed by [DIVERSITAS/IGBP](#), and the [Max Planck Institute for Biogeochemistry](#), providing a global archive of curated plant traits.

5.6 million trait records  
100,000 plant species  
largely open access

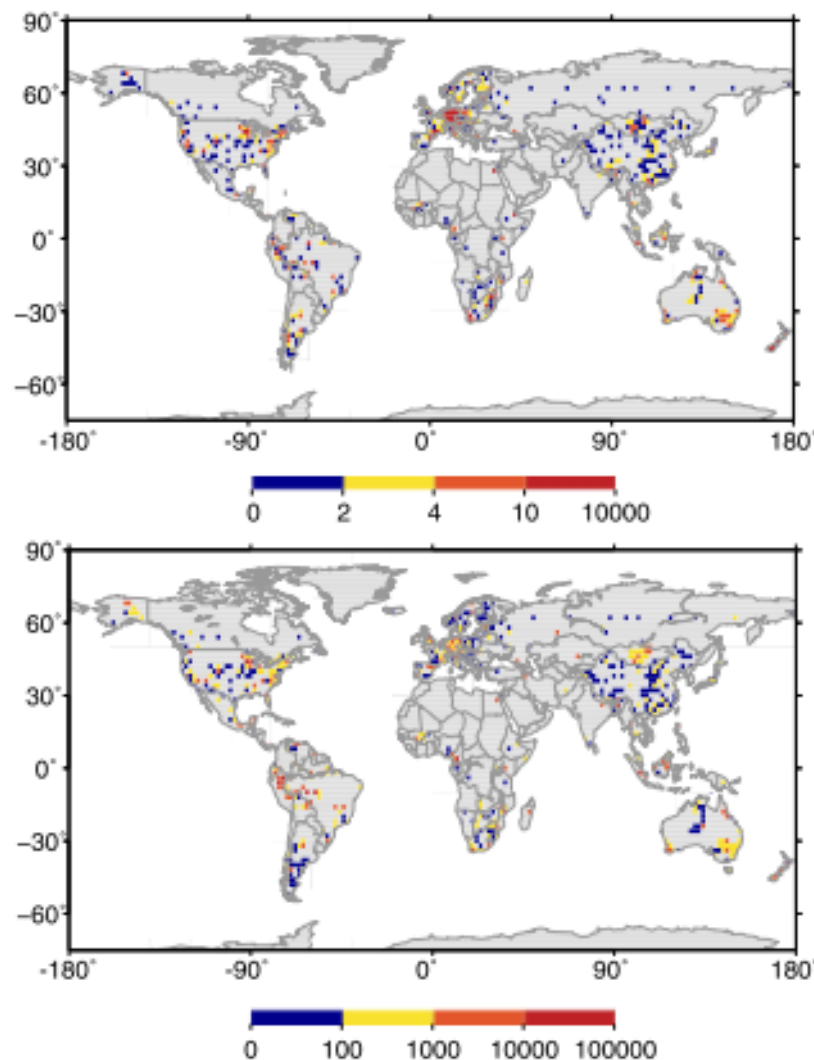

Fig. 2 Data density of georeferenced trait entries. Top, number of sites per  $2 \times 2^\circ$  grid cell; bottom, number of trait entries per grid cell.

## Updated parameters / processes

$N_m$  (leaf nitrogen content)

TRY (*Kattge et al., 2011*)

$SLA$  (specific leaf area index)

TRY

$g_{mes}$  (unstressed mesophyll conductance)

$V_{cmax}^*$  (TRY, *Kattge et al., 2009*)

$f_0$  (unstressed ratio of intracellular to air CO<sub>2</sub>)

*Domingues et al, 2013* (TrBE)

$A_{m,max}$  (max assimilation rate)

$V_{cmax}^*$  (TRY, *Kattge et al., 2009*)

leaf respiration

exponential decrease in canopy  
(*Bonan et al, 2011*)

sapwood respiration

added (*Kucharik et al, 2000*)

soil moisture stress

simplified for TrBE

\* Comparison Farquhar / Jacob photosynthesis models :

$g_{mes}$  = initial slope of Rubisco limited assimilation rate in Farquhar 1980

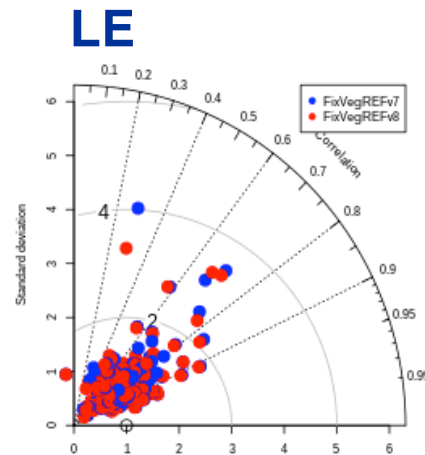

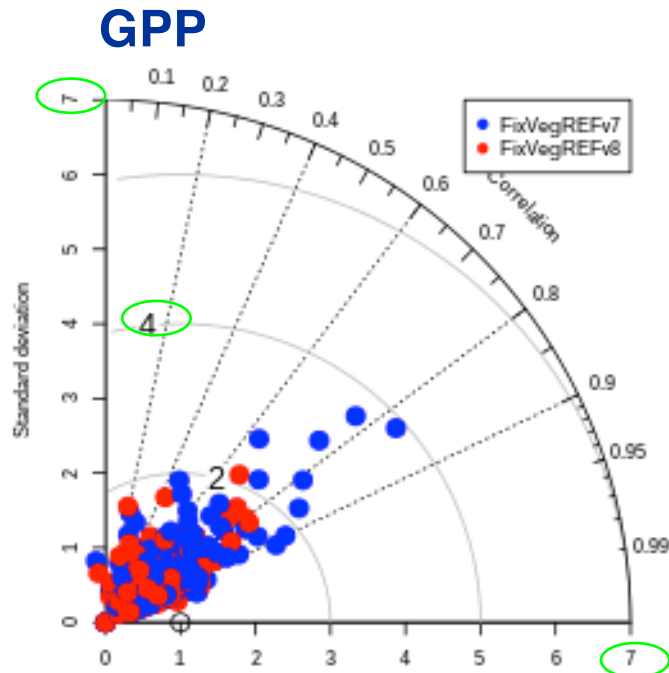

$A_{m,max} = 0.5 * V_{cmax}$

# benchmarking with Fluxnet sites

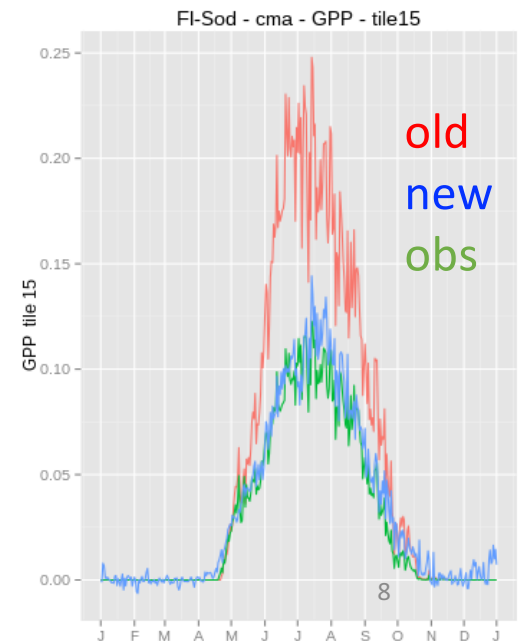

*N. Laaiana, R. Séférian, initiated by S. Lafont,*

	FluxNet	ISBA	<i>n</i>
Coniferous	ENF	TeNE, BoNE	37
Deciduous	DBF	TrBD, TeBD, BoBD	20
Evergreen	EBF	TrBE, TeBE	4
herbaceous	GRA	GRAS, BoGR, TroG	19
crop	CRO	C3, C4	15

old  
new

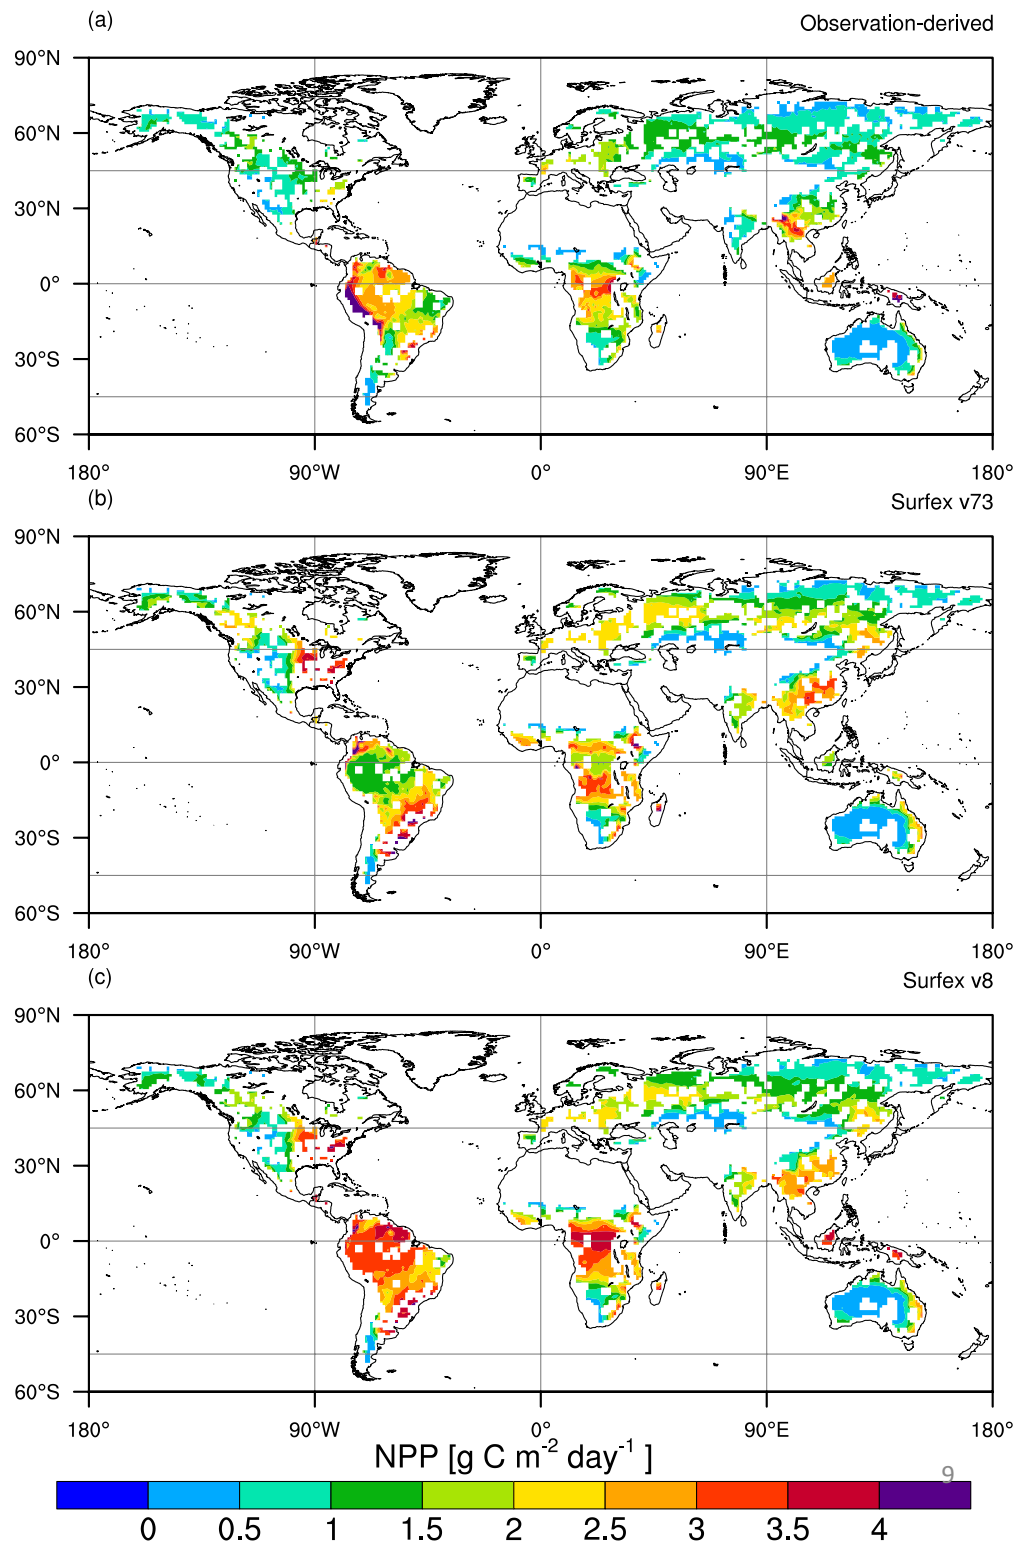

## Coniferous

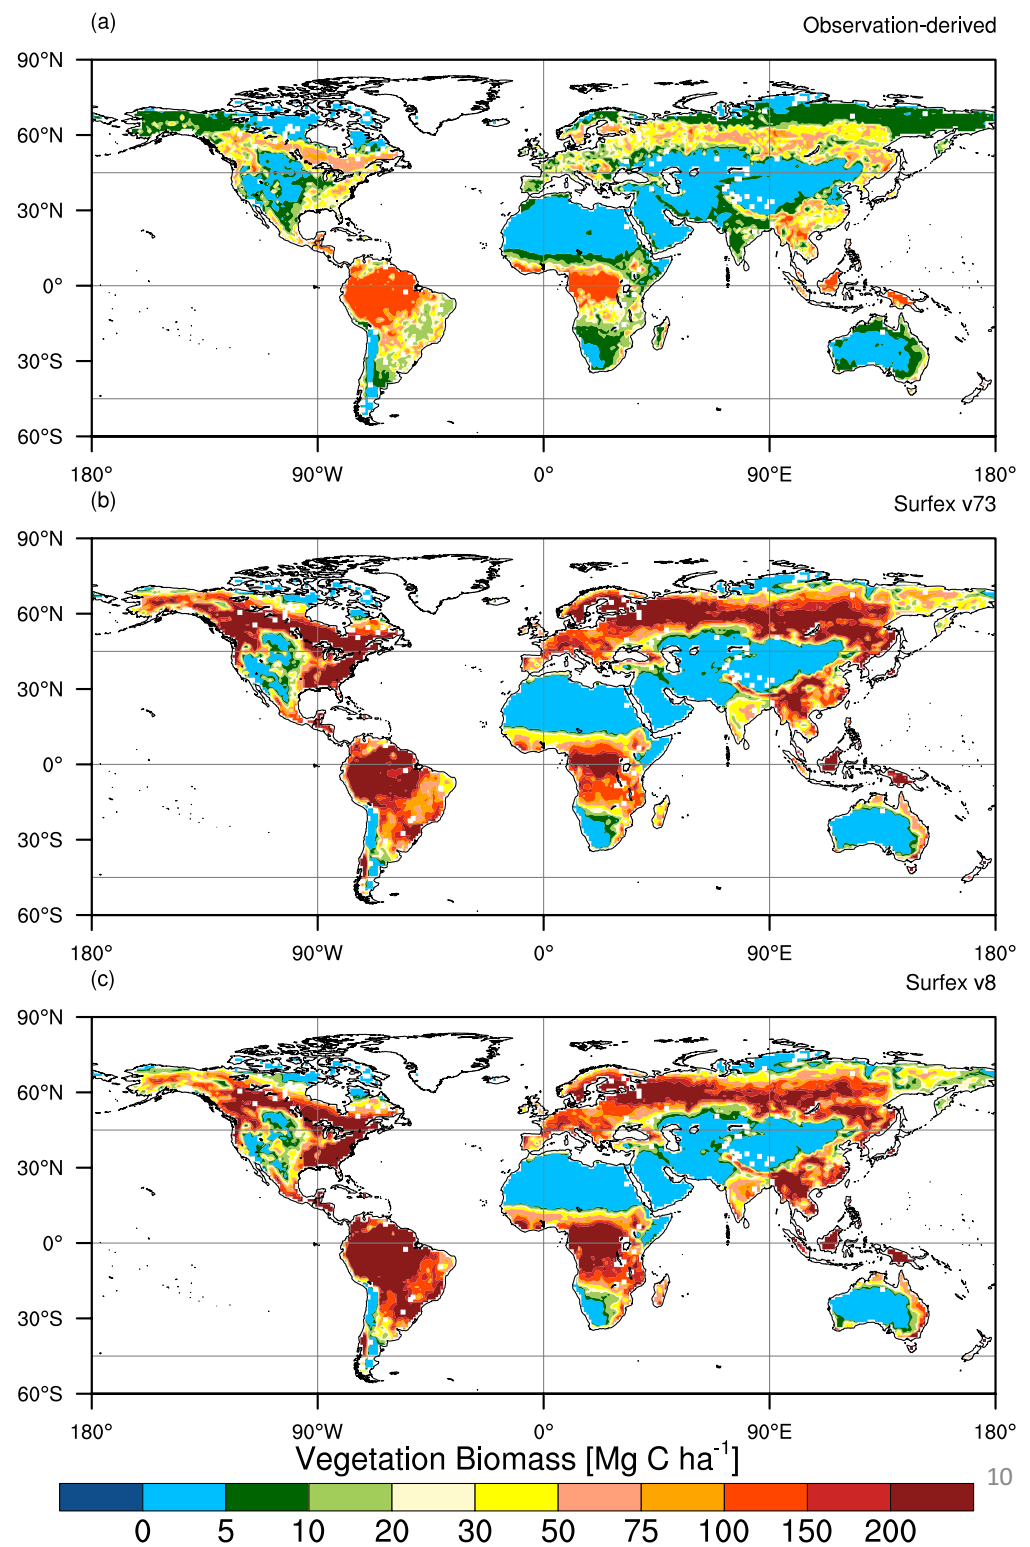

# Net Primary Productivity

*Running et al, 2003*

Still work to do ...  
vegetation biomass

9 → 16 vegetation types *R. Alkama*

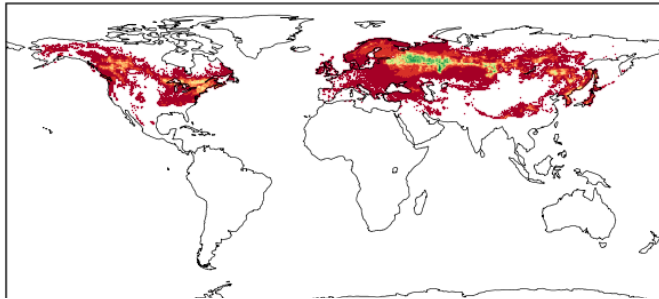

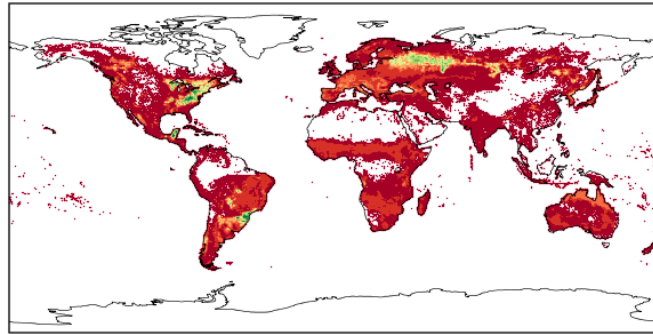

1. No
2. Rock
3. Permanent Snow/ice
  
6. EVER → TrBE Tropical Broadleaf Evergreen
7. C3 crop
8. C4 crop
9. C4 irrigated crop
11. TROG: Tropical grassland C4
12. PARK : Peat, Swamp, bog
